

Algorithm for factorial:

```

int fact(int n) {
    int x, y;
    if (n == 0)
        return 1;
    x = n - 1;
    y = fact(x);
    return (n * y);
}

```

The process for the call: fact(4)

n	x	y
Initially		
fact(4)	4	*
fact(3)	3	*
fact(2)	2	*

n	x	y
fact(1)	1	*
fact(0)	0	*
y = fact(0)	1	0
y = fact(1)	2	1

∴ In first call return 1

Afterwards

$n * y = y$

n	x	y
y = fact(2)	3	2
y = fact(3)	4	3
y = fact(4) = 24		

N-Queen's Problem

→  - 1x1 checker board

→ 2 queen's problem [2x2]

∴ 2 queen's problem has no-solution

Note: "These are called state space trees"

→ 3 queen's problem [3x3]

∴ 3-queen's problem have no solution

→ 4 queen's problem

∴ 4 queen's problem has 2 solutions

- The approach of N-queen problem is generalized to the problem technique "Back tracking".

Subset sum Problem:

$$A = \{1, 2, 3, 4, 5\} \quad K = 5$$

Prune tree - Cutting Off.

$$\text{Eg:- } A = \{3, 5, 6, 9\} \quad K = 9$$
